		tions	6

Before going through this sample use-case, please make sure that you have Java version 8 or above.

1 Requirements

This step is for one who do not have the Eclipse installation with all required plugins on your running computer.

Eclipse IDE installation

As a suggestion, you can have the required installation of Eclipse via either following options: 1

• Option A:

For one who does not have Eclipse installed, please download the following complete installation, with all plugins used in the use case via this link: http://miso.es/teaching/mde1718/eclipse.rar
In addition, please install the Epsilon plugins for ease of registering the meta-models.

- 1. On the toolbar of Eclipse IDE, click | Help / Install New Software...
- 2. In the Install pop-up window, in the Work with: section, entered:
 - http://download.eclipse.org/epsilon/updates/2.2/
- 3. Click Select All then complete the installation.

• Option B:

For one who does have Eclipse installed, please install the following plugins:

- Work with:

2020-09 - http://download.eclipse.org/releases/2020-09

- * General Purpose Tool
 - · Eclipse Plug-in Development Environment
- * Modeling
 - · Acceleo
 - · ATL SDK ATL Transformation Language SDK
 - Ecore Diagram Editor (SDK)
 - · EMF Eclipse Modeling Framework SDK
 - · OCL Examples and Editors SDK
 - · Xtext Complete SDK

¹Taken from the content of the Formal Model Driven Engineering class.

- Work with: http://download.eclipse.org/modeling/gmp/gmf-tooling/updates/releases-3.2.1/
- Work with:
 Work with: http://download.eclipse.org/modeling/emft/henshin/updates/release

2 Execution Instructions

2.1 Import the project and run configurations to Eclipse IDE Workspace

Download the project

- For the Professors in the course of FMDE at UAM: You will find the complete project in the directory MDS-SQLSI.
- For others, in case you clone the project from GitHub, please follow the follwing instructions:
 - Clone the project using URL. Example: git clone https://github.com/npbhoang/MDS-SQLSI.git
 - 2. Navigate to the project root. Example: cd MDS-SQLSI
 - 3. Checkout the correct branch for this sample use-case. Example: git checkout university-use-case

Import the project

If it is required, please create a new Eclipse workspace.

- 1. In Eclipse, on the tool bar, click File / Import
- 2. In the pop-up window, click General / Existing Projects into Workspace
- 3. In Select root directory: , browse the source project directory.
- 4. Select All projects and Finish.

Figure 1 shows what you should obtain in your Package Explorer afterwards.

```

Figure 1: Package Explorer after Step 1

Import run configurations

- 1. In Eclipse, on the tool bar, click File / Import
- 2. In the pop-up window, click $\boxed{{\tt Run/Debug}}\ / \boxed{{\tt Launch\ Configurations}}$
- 3. In the pop-up window, in From Directory: , browse the project uam.mde20.sqlsi.resources/launchConfigurations (in the source project).
- 4. Check the directory box and click Finish

2.2 Register meta-models

Register meta-models

 In the Project Explorer, navigate to uam.mde20.sqlsi.datamodels / metamodels / datamodels.ecore

- 2. Right click on datamodels.ecore and choose Register EPackages
- 3. In the Project Explorer, navigate to uam.mde20.sqlsi.relationaldbmodels / metamodels / relationaldb.ecore
- 4. Right click on relationaldb.ecore and choose Register EPackages
- 5. In the Project Explorer, navigate to uam.mde20.sqlsi.securitymodels / metamodels / securitymodels.ecore
- 6. Right click on securitymodels.ecore and choose Register EPackages

2.3 Transform models from specific DSL format to XMI format

- 1. In Eclipse, on the tool bar, click Run / Run Configurations
- 2. In the pop-up window, navigate to the run configuation: Java Application / [Java] Transform models to XMI.
- 3. Click Run.
- 4. Refresh the usecase.university project in the workspace. As the result, you can see two new XMI models, one is the university data-model and the other is the university security-model.

Figure 2: Project Explorer of new Eclipse instance after Step 3

2.4 Transform datamodel to relational database model, from which generate SQL schemata

Transform datamodel to relational database model

- 1. In Eclipse, on the tool bar, click Run / Run Configurations
- 2. In the pop-up window, navigate to the run configuation: ATL Transformation / [ATL] Transform datamodel to relaitonaldbmodel.
- 3. Click Run.
- 4. Refresh the usecase.university project in the workspace. As the result, you can see a new XMI model, which is the university relational database model.

Generate SQL schemata from relational database model

- 1. In Eclipse, on the tool bar, click Run / Run Configurations
- 2. In the pop-up window, navigate to the run configuation: Acceleo Application / [Acceleo] Transform relationaldbmodel to DB script.
- 3. Click Run.
- 4. Refresh the usecase.university project in the workspace. As the result, you can see a new SQL script that is executable in MySQL relational database management system.

Figure 3: Project Explorer of new Eclipse instance after Step 4

2.5 Manipulate security model then generate SQL authorization functions

Manipulate security model

- 1. In Eclipse, on the tool bar, click $\overline{\mathtt{Run}}$ / $\overline{\mathtt{Run}}$ Configurations
- 2. In the pop-up window, navigate to the run configuation: Java Application / [Henshin] Apply normalize transformation on securitymodel.
- 3. Click Run.
- 4. Refresh the usecase.university project in the workspace. As the result, you can see a new XMI "transformed" model, which is the university security model in the "normalized" form.

Generate SQL authorization functions from security model

- 1. In Eclipse, on the tool bar, click Run / Run Configurations
- 2. In the pop-up window, navigate to the run configuation: Acceleo Application / [Acceleo] Transform securitymodel to SQL authorization functions.
- 3. Click Run.

4. Refresh the usecase.university project in the workspace. As the result, you can see a new SQL script for authorization functions that is executable in MySQL relational database management system.

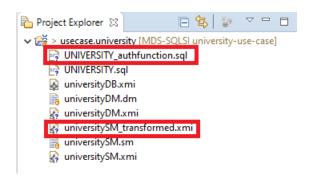

Figure 4: Project Explorer of new Eclipse instance after Step 5
